

TCIA CT COLONOGRAPHY (ACRIN 6664)
825 subjects, public, CC BY 3.0

Deterministic selection: first 30 patients by PatientID
with ≥ 2 axial series $\rightarrow$ 30 patients, 60 series
resampled to 1.0 mm isotropic

Headless pipeline, no human readers
centerline produced for 60 of 60 series
quality indices and pericolonic fat map for every series

Pillar 1: external reference

HQColon masks for
26 series (18 patients)

Dice, surface distance,
centerline coverage

Pillar 2: polyp measurement

geometric phantoms,
exact ground truth

diameter, volume,
sphericity

Pillar 3: prone/supine

position recovered from DICOM,
28 patients paired

ICC(2,1),
Bland-Altman

Excluded from pairing: 2 patients (one with a series in decubitus position [$n = 1$]; one with both series recorded as supine).

In-vivo polyp comparison not possible: 3 annotated lesions in the cohort and no 3-D coordinate in any annotation.
